### **Stem cell Wikipedia**

Stem cells are cells that can differentiate into other types of cells, and can also divide in self-renewal to produce more of the same type of stem cells.. In mammals, there are two broad types of stem cells: embryonic stem cells, which are isolated from the inner cell mass of blastocysts, and adult stem cells, which are found in various tissues. In adult organisms, stem cells and progenitor

### **New Articles Cell Stem Cell**

x Giambra et al. show that NOTCH1 leukemias generated from fetal liver are less transplantable than those from adult bone marrow. NOTCH1 activates auto/paracrine IGF1 signaling in FL, but not BM cells, due to EZH2-dependent H3K27 trimethylation at the IGF1 promoter. This mechanism can be exploited to exhaust/deplete leukemia stem cells.

### **Human Hippocampal Neurogenesis Persists cell com**

Boldrini et al. find persistent adult neurogenesis in humans into the eighth decade of life, despite declines in quiescent stem cell pools, angiogenesis, and neuroplasticity. Over a 65-year age span, proliferating neural progenitors, immature and mature granule neurons, glia, and dentate gyrus volume were unchanged.
