Comparison of fresh and frozen colostrums in transfer of

Mycobacterium avium subsp paratuberculosis (Map) is the etiological agent of Johne's disease. This infection is normally acquired by neonates. Ingestion of colostrum and milk contaminated with fecal material represents the major route of infection for newborns. Pasteurization of colostrum is promoted as a way to reduce the transmission of Map.

Mycobacterium bovis DNA Detection in Colostrum as a

We used a nested PCR to amplify a 208-bp fragment of the mpb70 gene specific to the Mycobacterium tuberculosis complex (30, 31). The results showed that 62% of the analyzed colostrum samples contained M. bovis DNA, while only 18% of the milk samples tested positive.

Localization of Mycobacterium avium subspecies

Mycobacterium avium ssp. paratuberculosis associated much less with the whey fraction, and this lesser association with whey was more pronounced for milk than for colostrum. In addition to a possibly naturally higher association with colostrum whey compared with milk whey, another possible explanation is that the curdling of milk and subsequent separation of milk curd and whey is more successful for milk than for colostrum.

Mycobacterium bovis DNA Detection in Colostrum as a

We previously found a high frequency of Mycobacterium bovis DNA in colostrum from dairy cows using a nested PCR to detect mpb70 . Since there are no reliable in vivo tests to determine the effectiveness of booster Mycobacterium bovis BCG vaccination against bTB, in this work we monitored M. bovis DNA in colostrum by using this nested PCR.
