Cleaning maintainence on a biological slow sand filter

A small biological sand filter (slow sand filter or Biosand filter) is maintained or cleaned by actively managing only the top 5 cm of sand. This top layer is either removed and replaced when the flow rate becomes unacceptable (typically 4 to 6 months) with clean sand or wet harrowed meaning the sand is gently agitated causing partial break up of the biological surface.

Designing a DIY slow sand filter what to consider Rain

Gravity feed is used on filter 1, filter 4, and filter 5. Filter 2 and 3 are fed by a small Direct current 12 volt pump that feeds water to them through a float valve system. Both ways work as long as the surface of the sand remains undisturbed. An overflow will allow the unfiltered water that flows in too fast to simply flow into your unfiltered storage tank. This way you don't lose any
