### **Hydraulic fracturing Wikipedia**

Hydraulic fracturing (also fracking, fraccing, frac'ing, hydrofracturing or hydrofracking) is a well stimulation technique in which rock is fractured by a pressurized liquid. The process involves the high-pressure injection of 'fracking fluid' (primarily water, containing sand or other proppants suspended with the aid of thickening agents) into a wellbore to create cracks in the deep-rock

### **Fracking Simple English Wikipedia the free encyclopedia**

Fracking, or hydraulic fracturing, is forcing fractures in a rock layer, by fluid that is put under pressure. Although it can happen naturally, it is now used as a method to force oil and natural gas from shale.. History and method. Some hydraulic fractures form naturally: certain dykes are examples. This lets gas and petroleum from source rocks get to reservoir rocks.
