Membrana cellulare Wikipedia

Secondo il "modello a mosaico fluido", proposto nel 1972 da S.J.Singer e G.L.Nicholson, il doppio strato lipidico della membrana plasmatica allo stato di liquido-cristallino ed in esso sono immerse numerose proteine, che grazie alla fluidità della componente lipidica presentano un notevole grado di mobilità; ad esse spetta lo svolgimento della gran parte delle funzioni di membrana.

Electron Transport in the Energy Cycle of the Cell

The eukaryotic cell's most efficient path for production of vital ATP is the aerobic respiration that takes place in the mitochondria. After glycolysis, the pyruvate product is taken into the mitochondria and is further oxidized in the TCA cycle. This cycle deposits energy in the reduced coenzymes which transfer that energy through what is called the electron transport chain.

Organoids Modeling Development and the Stem Cell Niche in

In 2009, our group described the successful derivation of epithelial organoid cultures from single Lgr5 + stem cells embedded in Matrigel and provided with culture medium containing EGF, Noggin, and R-spondin-1 (Sato et al., 2009). Stem cell proliferation first created cystic spheroids, which then formed crypt-like buddings that within 2 weeks further developed into mini-guts with
