### Organic Chemistry Alkanes and Cycloalkanes

Halogenation of alkanes occurs with halogen in the presence of heat or light and through a radical mechanism. In the mechanism of halogenation, radicals are formed in initiation. In propagation, radicals are consumed and radicals are formed. In termination, the radical are consumed.

### Alkane Wikipedia

Alkane. The alkanes have two main commercial sources: petroleum (crude oil) and natural gas . An alkyl group, generally abbreviated with the symbol R, is a functional group that, like an alkane, consists solely of single-bonded carbon and hydrogen atoms connected acyclically for example, a methyl or ethyl group .

### Organic Chemistry Alkenes Alkynes and Dienes

Dienes contain more than one carbon-carbon double bond. Alkenes, alkynes, and dienes are less dense than water, are nonpolar, and have boiling points and melting points similar to alkanes. The carbon in an alkene is sp<sup>2</sup>, has a bond angle of 120°, and a trigonal planar shape. A carbon-carbon double bond contains one sigma bond and one pi bond.

### CH105 Chapter 8 Chemistry

Fats that are fully saturated will only have fatty acids with long chain alkane tails. They are said to be saturated with hydrogen atoms. Saturated fats are common in the American diet and are found in red meat, dairy products like milk, cheese and butter, coconut oil, and are found in many baked goods.

### Organic Chemistry Alkanes and Cycloalkanes

Alkanes and cycloalkanes can be described in terms of their structure, properties, and uses. The conformations of ethane, butane, and cyclohexane are explained. Alkanes and cycloalkanes can be named by IUPAC or common nomenclature. Concept map showing interconnections of new concepts in this tutorial and those previously introduced.
