

E BEAM STERILIZATION

RELATED BOOK :**E Beam Sterilization Technology E BEAM Services**

The e-beam inactivates microorganisms either by causing microbial death as a direct effect of the destruction of a vital molecule, or by an indirect chemical reaction. Advanced electronics precisely control the use of electrons in the sterilization of medical devices and pharmaceuticals.

Electron beam processing Wikipedia

Electron-beam processing or electron irradiation (EBI) is a process that involves using beta radiation, usually of high energy, to treat an object for a variety of purposes. This may take place under elevated temperatures and nitrogen atmosphere. Possible uses for electron irradiation include sterilization and cross-linking of polymers.

STERILIZATION Energy Sciences Inc ebeam com

eb sterilization The Electron Beam process can achieve widely differing effects, such as sterilization, polymer modification, crosslinking and chain scission, via its action as an ionizing radiation. In its simplest terms, the bombardment of a material with high-energy electrons results in a cascade of these electrons moving through the target material.

Electron Beam Systems for Medical Device Sterilization

E-beam processing for medical devices involves the use of high-energy electrons--typically with energies ranging from 3 million to 10 million electron volts (MeV)--for the sterilization of single-use disposables.

How Does the Electron Beam Sterilization Process Work

The electron beam sterilization process begins with an electron beam accelerator. E-BEAM Services uses high power state of the art accelerators to create a powerful beam of electrons. The beam is scanned back and forth to create a curtain of fast electrons, which shower and safely ionize the materials that they strike.
