Compound interest is the addition of interest to the principal sum of a loan or deposit, or in other words, interest on interest. It is the result of reinvesting interest, rather than paying it out, so that interest in the next period is then earned on the principal sum plus previously accumulated interest.

Interest computed on the principal amount to which interest earned to-date has been added. Where compound interest is applied, the investment grows exponentially and not linearly as in the case of simple interest. Formula: Principal x { (Annual interest rate 100) + 1 } ^number of years. For example, \$1,000 at an annual compound interest rate of 10 percent will, in 5 years, be: $1000 \times \{ (100 + 10) / 100 \}^5$
