RELATED BOOK :

Epicyclic gearing Wikipedia

Epicyclic gearing or planetary gearing is a gear system consisting of one or more outer gears, or planet gears, revolving about a central, or sun gear. Typically, the planet gears are mounted on a movable arm or carrier, which itself may rotate relative to the sun gear.

Planetary Gearsets Gear Ratios How Gears Work

Choosing which piece plays which role determines the gear ratio for the gearset. Let's take a look at a single planetary gearset. One of the planetary gearsets from our transmission has a ring gear with 72 teeth and a sun gear with 30 teeth. We can get lots of different gear ratios out of this gearset.

In this gear system, the yellow gear (the sun) engages all three red gears (the planets) simultaneously. All three are attached to a plate (the planet carrier), and they engage the inside of the blue gear (the ring) instead of the outside.

Intro planetary gears also refer as epicyclic gearing consisting three elements sun gear, planet gear and ring gear. Sun gear is located at the center that transmits torque to planet gears orbiting around the sun gear. Both systems are located inside the ring gear.

How to Calculate Planetary Gear Ratio Sciencing

With four core components the ring gear, the sun gear and the planetary gears connected to the carrier the idea of calculating the gear ratio of a planetary system may sound daunting. However, the single-axis nature of the system makes it easy. Just be sure to note the state of the carrier in the gear system.
