**RELATED BOOK :****Class D amplifier Wikipedia**

A class-D amplifier or switching amplifier is an electronic amplifier in which the amplifying devices (transistors, usually MOSFETs) operate as electronic switches, and not as linear gain devices as in other amplifiers. They operate by rapidly switching back and forth between the supply rails, being fed by a modulator using pulse width, pulse density, or related techniques to encode the audio

Amplifier classes. Many modern RF amplifiers operate in different modes, called classes, to help achieve different design goals. Some classes are class A, class B, class C and class E. There is a Class D, but those amplifiers can work only with low frequency signals typically used in audio equipment.. Solid state vs. vacuum tube amplifiers. Modern RF power amplifiers use solid-state
