### **Stem cell Wikipedia**

Stem cells are biological cells that can differentiate into other types of cells and can divide to produce more of the same type of stem cells. They are always and only found in the multicellular organisms.. In mammals, there are two broad types of stem cells: embryonic stem cells, which are isolated from the inner cell mass of blastocysts, and adult stem cells, which are found in various tissues.

### **Induced pluripotent stem cell Wikipedia**

Induced pluripotent stem cells (also known as iPS cells or iPSCs) are a type of pluripotent stem cell that can be generated directly from adult cells. The iPSC technology was pioneered by Shinya Yamanaka's lab in Kyoto, Japan, who showed in 2006 that the introduction of four specific genes encoding transcription factors could convert adult cells into pluripotent stem cells.

HSCs (haematopoietic stem cells) adult stem cells that are found in bone marrow and blood. HSCs are capable of producing all of the cells that make up the blood and the immune system. MSCs (mesenchymal stem cells) adult stem cells found in several places in the body, including the bone marrow, skin and fat tissue. They produce cells which help other stem cells function properly.

### **Stem Cell Therapy and Stem Cell Injection Provider Finder**

Stem cell therapy can be described as a means or process by which stem cells are used for the prevention, treatment or the cure of diseases. Stem cells are a special kind of cells that have features other types of cells don't have. As an illustration, stem cells are capable of proliferation.

### **Induction of Pluripotent Stem Cells from Mouse Embryonic**

Differentiated cells can be reprogrammed to an embryonic-like state by transfer of nuclear contents into oocytes or by fusion with embryonic stem (ES) cells. Little is known about factors that induce this reprogramming. Here, we demonstrate induction of pluripotent stem cells from mouse embryonic or adult fibroblasts by introducing four factors, Oct3/4, Sox2, c-Myc, and Klf4, under ES cell

### **Induction of Pluripotent Stem Cells from Adult Human**

Successful reprogramming of differentiated human somatic cells into a pluripotent state would allow creation of patient- and disease-specific stem cells. We previously reported generation of induced pluripotent stem (iPS) cells, capable of germline transmission, from mouse somatic cells by transduction of four defined transcription factors.

### **Arguments for Embryonic Stem Cell Research Stem Cells**

The benefits of stem cell research outweigh the cost in terms of embryonic life. Embryonic stem cells have the capacity to grow indefinitely in a laboratory environment and can differentiate into almost all types of bodily tissue.

### **What are Progenitor Cells Boston Children's Hospital**

Often confused with adult stem cells, progenitor cells are early descendants of stem cells that can differentiate to form one or more kinds of cells, but cannot divide and reproduce indefinitely. A progenitor cell is often more limited than a stem cell in the kinds of cells it can become. Nonetheless, progenitor cells do have potential uses in medicine.
