RELATED BOOK :

BLDC Motor Control with Simulink MATLAB Simulink

Trapezoidal BLDC motor control is a simpler technique than field-oriented control; it energizes only two phases at a time. Only one PID controller is required for torque control, and, as opposed to field-oriented control, there is no need for coordinate transformations using Park and Clarke transforms.

Speed Control of BLDC Motor Electrical Concepts

Speed control of BLDC motor is essential for making the motor work at desired rate. Speed of a brushless dc motor can be controlled by controlling the input dc voltage / current. The higher the voltage more is the speed. Many different control algorithms have been used to provide control of BLDC motors. The motor voltage is controlled using a

Sensorless BLDC motor control with PIC microcontroller and

The commutation of sensorless BLDC motor is based on the BEMF (Back Electromotive Force) produced in the stator windings. The main advantage of the sensorless BLDC motor control is lower system cost and the main disadvantage is the motor must be moving at minimum rate to produce sufficient BEMF to be sensed.
