Due to the nature of embryonic stem cell research, there are a lot of controversial opinions on the topic. Since harvesting embryonic stem cells necessitates destroying the embryo from which those cells are obtained, the moral status of the embryo comes into question.

Embryonic stem cells are isolated from cells in a blastocyst, a very early stage embryo. Once isolated from the blastocyst, these cells form colonies in culture (closely packed groups of cells) and can become cells of the three germ layers, which later make up the adult body.

### **Stem cell Wikipedia**

Stem cells are cells that can differentiate into other types of cells, and can also divide in self-renewal to produce more of the same type of stem cells.. In mammals, there are two broad types of stem cells: embryonic stem cells, which are isolated from the inner cell mass of blastocysts, and adult stem cells, which are found in various tissues. In adult organisms, stem cells and progenitor

x Giambra et al. show that NOTCH1 leukemias generated from fetal liver are less transplantable than those from adult bone marrow. NOTCH1 activates auto/paracrine IGF1 signaling in FL, but not BM cells, due to EZH2-dependent H3K27 trimethylation at the IGF1 promoter. This mechanism can be exploited to exhaust/deplete leukemia stem cells.
