### **Honey bee Wikipedia**

A honey bee (or honeybee) is a eusocial, flying insect within the genus *Apis* of the bee clade. They are known for construction of perennial, colonial nests from wax, for the large size of their colonies, and for their surplus production and storage of honey, distinguishing their hives as a prized foraging target of many animals, including honey badgers, bears and human hunter-gatherers.

### **Western honey bee Wikipedia**

Unlike most other bee species, honey bees have perennial colonies which persist year after year. Because of this high degree of sociality and permanence, honey bee colonies can be considered superorganisms, meaning that reproduction of the colony, rather than individual bees, is the biologically significant unit. Honey bee colonies reproduce through a process called "swarming".

### **Honey bee Honey bee**

Honey bee (*Apis mellifera*) is an insect species living in colonies. In the colony there is usually one queen, thousands of workers and during some parts of the year variable number of drones. New colonies are produced by swarming. The colony lives in a nest which in nature is usually located inside a hollow tree. In the nest there is a series of vertical combs built from wax.

### **The Honey Bee Life Cycle BuzzAboutBees.net**

Unlike bumblebee colonies, honey bee (*Apis mellifera*) colonies can survive the winter, provided they have enough food resources, are able to keep sufficiently warm, and are free of diseases and predators. However, in the winter, colonies are smaller than in the summer: there are no drones, and perhaps part of the colony left the hive (in a swarm) to form a new nest elsewhere.
