RELATED BOOK :

Class A Amplifier is a Class A Transistor Amplifier

The most commonly used type of power amplifier configuration is the Class A Amplifier. The Class A amplifier is the simplest form of power amplifier that uses a single switching transistor in the standard common emitter circuit configuration as seen previously to produce an inverted output.

Class A Power Amplifiers. The purpose of class A bias is to make the amplifier relatively free from distortion by keeping the signal waveform out of the region between 0V and about 0.6V where the transistor's input characteristic is non linear. Class A design produces good linear amplifiers, but are wasteful of power.

Amplifier Wikipedia

Class-A amplifiers generally use only one device, unless the power supply is set to provide both positive and negative voltages, in which case a dual device symmetrical design may be used. Class-C amplifiers, by definition, use a single polarity supply. Amplifiers often have multiple stages in cascade to increase gain.

Amplifier Classes and the Classification of Amplifiers

The class AB amplifier is a variation of a class B amplifier as described above, except that both devices are allowed to conduct at the same time around the waveforms crossover point eliminating the crossover distortion problems of the previous class B amplifier.

How to Select the Best Audio Amplifier for Your Design

Class G amps are more efficient than Class AB amps because they use the maximum supply voltage only when required; in contrast, Class AB amps always use the maximum supply voltage. There is a common problem in portable audio applications: the limited supply voltage available to the speaker amp.
