Excel formula to convert per annum interest rate to

The compound interest formula is: $I = P(1 + r)^n - P$ I is interest P is principal r is rate n is the number of interest periods incurred. Your original equation turned into: $10000 = 100000(1 + .1)^1 - 100000$ To find your daily rate after a year where your principle is 100,000 and your interest is 10,000 use

Interest Wikipedia

Interest is payment from a borrower or deposit-taking financial institution to a lender or depositor of an amount above repayment of the principal sum (i.e., the amount borrowed), at a particular rate. It is distinct from a fee which the borrower may pay the lender or some third party. It is also distinct from dividend which is paid by a company to its shareholders (owners) from its profit or

Compound interest Wikipedia

Compound interest is the addition of interest to the principal sum of a loan or deposit, or in other words, interest on interest. It is the result of reinvesting interest, rather than paying it out, so that interest in the next period is then earned on the principal sum plus previously accumulated interest.

Continuously Compounded Interest Formula and Calculator

Periodically and Continuously Compounded Interest. Back when Elvis was King and computers were scarce (and could that really be just a coincidence?) banks used to compound interest quarterly. That meant that four times a year they would have an "interest day", when everybody's balance got bumped up by one fourth of the going interest rate

Working the formula backwards. If you want to work backwards and find out how much you would need to start with in order to achieve a chosen future value, try the following version of the formula: $P = A / (1 + r/n)^{nt}$. Let's say your goal is to end up with \$10,000 in 5 years, and you can get an 8% interest rate on your savings, compounded monthly.
