Primary biliary cholangitis Wikipedia

Primary biliary cholangitis (PBC), previously known as primary biliary cirrhosis, is an autoimmune disease of the liver. It results from a slow, progressive destruction of the small bile ducts of the liver, causing bile and other toxins to build up in the liver, a condition called cholestasis. Further slow damage to the liver tissue can lead to scarring, fibrosis, and eventually cirrhosis.

Primary Biliary Cholangitis American Liver Foundation

What causes Primary Biliary Cholangitis? The cause of this disease is unknown. It may be related to problems in the immune system. Although PBC is technically not a hereditary disease, meaning a disease caused by a specific gene or genetic defect that is passed from parent to child, there appears to be some family link.

Primary Biliary Cirrhosis Life Expectancy Symptoms

Primary biliary cirrhosis (PBC) is a progressive disease of the liver caused by a buildup of bile within the liver (cholestasis) that results in damage to the small bile ducts that drain bile from the liver. Over time, this pressure build-up destroys the bile ducts leading to liver cell damage. As the disease progresses and enough liver cells die, cirrhosis and liver failure occur.
