### **Class D amplifier Wikipedia**

A class-D amplifier or switching amplifier is an electronic amplifier in which the amplifying devices (transistors, usually MOSFETs) operate as electronic switches, and not as linear gain devices as in other amplifiers. They operate by rapidly switching back and forth between the supply rails, being fed by a modulator using pulse width, pulse

Linear Amplifiers, Class D Amplifiers, and Power Dissipation. Linear-amplifier output stages are directly connected to the speaker (in some cases via capacitors). If bipolar junction transistors (BJTs) are used in the output stage, they generally operate in the linear mode, with large collector-emitter voltages.

What Is A Class D Amplifier? As you probably know, amplifiers are divided into different classes. Everything began with a simple Class-A amplifier, which was analog in nature and capable of providing excellent sound fidelity to its users.

Even so, the efficiency of a practical Class-D amplifier can be better than 90 percent, which is significantly better than a Class-AB design (78.5 percent at best and typically closer to 50 percent). Coming full circle, because a Class-D amplifier is more efficient than the conventional Class-AB one, it can be lighter.

### **Class D Amplifiers Fundamentals of Operation and Recent**

Class D Amplifiers: Fundamentals of Operation and Recent Developments Abstract: A Class D amplifier's high efficiency makes it ideal for portable and compact high-power applications. Traditional Class D amplifiers require an external lowpass filter to extract the audio signal from the pulse-width-modulated (PWM) output waveform.

Because of this, the amplifier does not generate a lot of heat and does not require a big heat sink like linear class

AB amplifiers do. For comparison, the class B amplifier can only achieve a maximum efficiency of 78.5% (in theory). Below you can see the block diagram of a basic PWM Class-D amplifier, just like the one that we are building.

Class A amplifiers are the most linear design with the least amount of distortion, but at the expense of efficiency. On the other side of the spectrum, the efficiency of Class D amplifiers can be above 90% but at the expense of linearity and distortion.\*
