Stem cell Wikipedia

Stem cells are cells that can differentiate into other types of cells, and can also divide in self-renewal to produce more of the same type of stem cells.. In mammals, there are two broad types of stem cells: embryonic stem cells, which are isolated from the inner cell mass of blastocysts, and adult stem cells, which are found in various tissues. In adult organisms, stem cells and progenitor

New Articles Cell Stem Cell

x Giambra et al. show that NOTCH1 leukemias generated from fetal liver are less transplantable than those from adult bone marrow. NOTCH1 activates auto/paracrine IGF1 signaling in FL, but not BM cells, due to EZH2-dependent H3K27 trimethylation at the IGF1 promoter. This mechanism can be exploited to exhaust/deplete leukemia stem cells.

Interspecies Chimerism with Mammalian Pluripotent Stem

Interspecies blastocyst complementation enables organ-specific enrichment of xenogenic pluripotent stem cell (PSC) derivatives. Here, we establish a versatile blastocyst complementation platform based on CRISPR-Cas9-mediated zygote genome editing and show enrichment of rat PSC-derivatives in several tissues of gene-edited organogenesis-disabled mice.
