Wind power Wikipedia

Wind power is the use of air flow through wind turbines to provide the mechanical power to turn electric generators. Wind power, as an alternative to burning fossil fuels, is plentiful, renewable, widely distributed, clean, produces no greenhouse gas emissions during operation, consumes no water, and uses little land. The net effects on the environment are far less problematic than those of

Wind Power. For thousands of years, humans have harnessed the wind to push sails, mill grain, and pump water.

Today, windmills use turbines to convert rotational energy into electricity that can reliably flow into to a grid.
